Architecture Discoverability and Verification

Agata Przybyszewska

Architect, coder and DevOps engineer · MathMagicians

Senior Enterprise Architect · DSV

Faglig Fredag · 30 October 2026

Background

Big enterprise, stale docs

Tech stack

- Why Java? Enterprise.
- Eventing
  - Confluent, expensive
  - Strimzi, a Kafka distribution
  - Cloudflare
- Docker + Docker Compose to run it
- Cucumber for BDD
- Slidev in a Docker container, for these slides

Platform engineering is a skill

Meet Wonderland, a toy platform

Built to explore the core ideas

Spec driven

Discovery → Formulation → Automation → Verification

Each release ends in production

Must architecture docs always go stale?

Three questions

Wonderland plays stories on Kafka

1 · Declare it in the code

The hexagon

The annotation is the spec

2 · Verify it

Two rules, plain unit tests

Live: break the hexagon

3 · Clients get the checks for free

The purse extends the rules

The purse reuses the steps

4 · One model, three levels

Code in, model out

Three levels

The model

Facts found, views chosen

Level 1 · The forest

Level 2 · The trees

Level 3 · The hexagon

Where the facts live

Same stories, three transports

5 · The agent round trip

What the agent gets

The skill: generate a platform client

Live: an agent builds a new purse

Gates the agent can’t argue with

Back in the model

Three answers

Thanks! Questions?
