Architecture Discoverability and Verification

Agata Przybyszewska

Architect, coder and DevOps engineer · MathMagicians

Senior Enterprise Architect · DSV

Faglig Fredag · 30 October 2026

Background

The problem: architecture documentation goes stale in large enterprises

Why Java: the language of the enterprise setting

Platform engineering is a skill

Wonderland: a toy platform to illustrate the key points

Must architecture documentation always go stale?

Three questions for today

Wonderland plays stories on Kafka

1 · Declare the architecture in the code

The hexagon, ring by ring

The annotation is the specification

2 · Verify that the code matches it

Two rules, run with the unit tests

Live demo: break the hexagon on purpose

3 · A client inherits the checks

The purse gets the rules by extending them

A client’s feature on platform steps

4 · One generated model, three levels

From the code to a committed model

Three levels, one model

The model, as the build writes it

Facts are found, views are chosen

Level 1 · The forest: whom the platform talks to

Level 2 · The trees: containers and what flows between them

Level 3 · One tree: the hexagon of a story

Where each fact lives in the code

Same stories, three transports

5 · The agent round trip

The specification the agent gets

The skill: generate a platform client from the architecture spec

Live demo: an agent builds a new purse

Deterministic gates around the agent

Back in the model: the new story in the DSL

Three questions, three answers

Thank you. Questions?
